

ABSTRAK

ANALISIS ASUHAN KEPERAWATAN PADA ANAK DENGAN PENYAKIT GINJAL KRONIS YANG SEDANG MENJALANI HEMODIALISA DAN INTERVENSI RETRIKSI CAIRAN TERHADAP HIPERVOLEMIA DI RUANG PICU RSUD AL-IHSAN PROVINSI JAWA BARAT

Rifki Afdilah Fazri

Mahasiswa Profesi Ners, Fakultas Keperawatan Universitas Bhakti Kencana
Bandung

Tahun 2013 dan 2018 menunjukkan bahwa prevalensi penyakit gagal ginjal kronis di Indonesia dengan rentang usia ≥ 15 tahun berdasarkan diagnosis dokter pada tahun 2013 adalah 0,2% dan meningkat pada tahun 2018 sebesar 0,38% atau mencapai 499.800 orang. Metode karya ilmiah ini yaitu metode deskriptif dengan metode studi kasus. Metode pengumpulan data yang dilakukan dengan menggunakan format asuhan keperawatan sesuai dengan ketentuan yang berlaku di Prodi Profesi Keperawatan Universitas Bhakti Kencana Bandung. Hasil intervensi yang diberikan selama 3 hari, dengan waktu edukasi selama <30 menit didapatkan hasil peningkatan pengetahuan tentang retriksi cairan, ada juga penurunan tekanan darah dan cairan. Klien dan keluarga bisa menyebutkan kembali dan mengetahui bagaimana memantau tentang cairan klien dengan hitungan jika urin <0,5 mL/kg/jam maka dianjurkan melapor kepada tenaga kesehatan. Diharapkan pihak institusi dan pemberi asuhan mampu memberikan edukasi terkait manajemen cairan sesuai dengan ketentuan, karena pada penelitian yang sudah dilakukan pengetahuan klien dan keluarga mengalami peningkatan.

*Nurse Professional Student, Faculty of Nursing, Bhakti Kencana University
Bandung*

In 2013 and 2018, it was shown that the prevalence of chronic kidney failure in Indonesia with an age range of ≥ 15 years based on a doctor's diagnosis in 2013 was 0.2% and increased in 2018 by 0.38% or reached 499,800 people. The method of this scientific work is a descriptive method with a case study method. The data collection method is carried out using a nursing care format in accordance with the applicable provisions in the Nursing Profession Study Program, Bhakti Kencana University Bandung. The purpose of this final scientific work is to analyze the nursing care of An Z with chronic kidney disease problems who are undergoing hemodialysis with Retraction intervention at Al-Ihsan Hospital, West Java. The results of the intervention given for 3 days, with an education time of <30 minutes, were obtained as a result of increasing knowledge about fluid restriction, there was also a decrease in blood pressure and fluids. The conclusion of the analysis of nursing care in An Z is partially resolved. Clients and their families can mention again and know how to monitor the client's fluids by calculating if the urine <0.5 mL/kg/hour, it is recommended to report to health workers. It is hoped that the institution and caregivers will be able to provide education related to fluid management in accordance with the provisions, because in the research that has been carried out, the knowledge of clients and families has increased.
